AYHAM KLAANI

Full-Stack Product Engineer · AI Agents · Mobile

Israel | +972-50-431-5245 | aklaani508@gmail.com | www.ayham.work | linkedin.com/in/ayham-klaani-31b81b157 | github.com/AyhamAk

Full-stack product engineer with 4+ years at BMC Software — shipping production multi-agent AI systems for enterprise customers, supporting clients directly and delivering patches to production, and independently publishing trilingual mobile apps with real users on iOS and Android. I own features from user problem to measured outcome: scoping, building across Angular / Java / Node / mobile, and iterating on feedback.

EXPERIENCE

Software Engineer

BMC Software · Sep 2023 – Present

- Architected and shipped a production multi-agent AI system (Google ADK + Claude on AWS Bedrock) — orchestrator plus 4 specialized sub-agents — giving Control-M enterprise users a natural-language interface to create and update workflow jobs.
- Built an AI test-generation pipeline (RAG over 600+ existing Playwright builders) that cut integration-test authoring time from ~5 hours to ~1 hour per test.
- Built RAG knowledge bases enabling AI agents to navigate and reason over large enterprise codebases; integrated MCP servers into local dev workflows and demoed AI-driven developer tooling to the broader team.
- Owned core Forecast domain features end-to-end — Angular frontend and Java REST backend — across both On-Prem and SaaS deployments, serving enterprise clients.
- Led technical support sessions directly with enterprise customers: reproduced production issues, shipped targeted patches, and delivered resolutions — turning customer-reported bugs into shipped fixes with minimal back-and-forth.
- Designed CI/CD pipelines and a Kibana monitoring dashboard that cut failed-build detection from hours to minutes; drove Angular upgrades across 3 major versions.
- Expanded automated test coverage with Robot Framework; mentored student developers on the team as tech lead on AI-powered features.

Product Developer Intern

BMC Software · May 2022 – Sep 2023

- Shipped full-stack features to production quality alongside senior developers; built Git automation tooling and debugging scripts that streamlined team workflows.
- Promoted to full-time Software Engineer after one year based on output and ownership.

SHIPPED PRODUCT

Steps Academy — Trilingual Montessori Parent & Staff App

Solo Developer · iOS & Android · 2026 · App Store & Google Play

- Sole developer: scoped, designed, built and published a trilingual (Arabic / Hebrew / English, full RTL) parent app — 30+ families onboarded across iOS and Android within weeks of launch.
- Parents get a child-specific photo gallery (private to each family via invite-code onboarding), the academy's daily nursery schedule, after-school course sign-ups with evening reminders, parenting tip videos, and push-notification announcements.
- Built the full backend on Railway + Supabase + Cloudflare R2: JWT auth, role-based access control, invite-code onboarding, push notifications, and a web admin panel (api.steps-academy.com/dashboard) for rosters, child-tagged album uploads, weekly schedule templates, course management, and per-user engagement analytics.
- Shipped OTA updates to skip store review cycles; infrastructure cost ~$0/month (Railway + Supabase + Cloudflare R2 free tiers); $99/year for Apple, one-time for Google.

PERSONAL PROJECTS

War Room — Multi-Agent AI Orchestration System

Private project · Node.js · LangGraph · Claude & Gemini APIs · Playwright

- 6 specialized LLM agents (Director, Engineer, Designer, Developer, QA, Sales) autonomously plan, build and ship working web apps from a one-line brief.
- Self-correcting agent loop with real-time streaming via SSE; each agent has scoped tools and a defined handoff protocol.

AI Content Automation Pipeline

Private project · n8n · Docker · ElevenLabs · Claude API

- End-to-end pipeline: Google Sheets → Claude (script generation) → ElevenLabs (voiceover) → Telegram (delivery) — fully automated video content production with zero manual steps per episode.

Shakkil — AI-Driven CAD Drafting App

Private project · AutoCAD 2027 · Blender MCP · TypeScript

- Local web app where a user describes what they want to draft; AI agents generate and execute the CAD commands via AutoCAD and Blender MCP integrations.

SKILLS

Languages:	TypeScript · JavaScript · Java · Python
AI / LLM:	Multi-Agent Orchestration · RAG · MCP · Google ADK · LangGraph · Claude & Gemini APIs · AWS Bedrock · Prompt Engineering · Claude Code
Frontend:	Angular · HTML/CSS
Backend:	Java REST APIs · Spring Boot · Node.js
Mobile:	React Native / Expo · App Store & Google Play · OTA updates
Cloud/Infra:	Supabase · Cloudflare R2 · Railway · Jenkins · CI/CD · Kibana · Git
Testing:	Playwright · Robot Framework

EDUCATION

B.Sc. Computer Science

Tel-Hai College — Software Development · 2019 – 2023 · Projects: full-stack student housing platform (Angular / Node.js); real-time people-detection system (Python, OpenCV)

LANGUAGES

Arabic (Native) · English (Fluent) · Hebrew (Fluent)
